

Abstract

Drug Delivery System and Method

5 A method for delivering a therapeutic agent to
a predetermined location in a host is disclosed, wherein
a liposome-encapsulated therapeutic agent is administered
to the host, and an electrical field which encompasses a
predetermined region within the host is established, such
that as the liposome-encapsulated agent is exposed to the
electrical field the release of the agent from the
10 liposome to the predetermined region is enhanced.
